CUSTOMER SUPPORT AGENTS, AIS LIVE, 18 OCT

Worksheet: plan your support agent, layer by layer

Fill this in during the session or after. Most boxes are one layer. When you are done, you have the plan for your first version.

Where are you today?
Where do customer messages arrive (email, help desk, site chat, a form, a community, WhatsApp)? About how many a week? Who answers them, and how many hours does it take?

L1 Channel: where tickets come in and replies go out

One channel for the first version, and how a new message reaches your agent
A help desk webhook, a shared inbox, a form. Which messages must never get an automatic reply? (auto-replies, bounces, tickets a person already took)

L2 Agent: what kinds of tickets do you get?

Ticket type	A real example (rewritten, no names)	Send / draft / hand off	Hand off to
Other / not sure		Hand off	

L3 Knowledge: where do the answers live?

Where your answers live today, and who keeps them up to date
Help pages, old replies, a FAQ, someone's head. Collect your top 10 questions with the answer you already give and a link to its source. How often will someone check them?

L4 Customer data: who is writing?

Where the customer record is, and how you know the writer owns the account
CRM, billing tool, a sheet. They write from the email on file, they are logged in, or you send a code to the email on file. Which fields does the agent need? Which should it never see?

L5 Actions and rules: what can it do?

The actions it could take, and the rule behind each one

Send a new access link, change a plan, open a refund request. Write each rule as "if ... then ...", for example "If the purchase is less than __ days old and ..., then the refund is allowed." Rules go in code. Which actions should only create a request for a person?

L6 Hand-off: when does it stop, and who takes over?

When the agent must stop, who gets the ticket, and what the customer hears

Angry customer, legal threat, a request for an exception, it is not sure, the identity check fails. Where does the person see it, and how fast do they answer? What does the customer hear, for example "A person will reply within one working day"? If the agent says no, how can the customer ask a person to look again?

L7 Log and tests: how will you know it works?

Your test set and what you log

Pick 20 past tickets, rewrite them without names, and write the right outcome for each. Run each one several times. A ticket type may send on its own only when it gets every run right. For each step, log the ticket, the type, the tools used, the decision, and who sent the reply.

Next My first step this week

One thing

For example: collect my top 10 answers in one file. Then run 20 past tickets through the agent, with sending turned off.
